

MS: SEA 82

ASSEMBLY MANUAL

Specifications

Wingspan	70.9 in	180cm.
Wing area	863.4 sq.in	55.7 sq.dm.
Approximate flying weight	10.6 lbs	4.8kg.
Length	46.6in	118.3cm.
Recommended engine size	1.20 cu.in	2-stroke.
	.1.50cu.in	4-stroke.
Radio System required 4 channels	with 6 servos	

Flying skill level Intermediate/advanced.

Kit features.

- Ready-made—minimal assembly & finishing required.
- Ready-covered covering.
- Photo-illustrated step-by-step Assembly Manual.

Made in Vietnam.

INTRODUCTION.

Thank you for choosing the **GEEBEE** ARTF by SEAGULL MODELS. The **GEEBEE** was designed with the intermediate/advanced sport scale in mind. It is a semi scale airplane which is easy to fly and quick to assemble. The airframe is conventionally built using balsa, plywood to make it stronger than the average ARTF, yet the design allows the aeroplane to be kept light. You will find that most of the work has been done for you already. The motor mount has been fitted and the hinges are pre-installed. Flying the **GEEBEE** is simply a joy.

This instruction manual is designed to help you build a great flying aeroplane. Please read this manual thoroughly before starting assembly of your **GEEBEE**. Use the parts listing below to identify all parts.

WARNING.

Please be aware that this aeroplane is not a toy and if assembled or used incorrectly it is capable of causing injury to people or property. WHEN YOU FLY THIS AEROPLANE YOU ASSUME ALL RISK & RESPONSIBILITY.

If you are inexperienced with basic R/C flight we strongly recommend you contact your R/C supplier and join your local R/C Model Flying Club. R/C Model Flying Clubs offer a variety of training procedures designed to help the new pilot on his way to successful R/C flight. They will also be able to advise on any insurance and safety regulations that may apply.

ADDITIONAL ITEMS REQUIRED.

- □ .1.2 cu.in 2-stroke engine.
- .1.5 cu.in 4-stroke engine.
 4 channels with 6 servos.
- Glow plug to suit engine
- Propeller to suit engine
- Protective foam rubber for radio system
- □ Silicone fuel line

TOOLS & SUPPLIES NEEDED.

- Thick cyanoacrylate glue
- □ 30 minute epoxy
- □ 5 minute epoxy
- □ Hand or electric drill
- □ Assorted drill bits
- □ Modelling knife
- □ Straight edge ruler
- □ 2mm ball driver
- Phillips head screwdriver
- □ 220 grit sandpaper
- 90° square or builder's triangle
- □ Wire cutters
- Masking tape & T-pins
- □ Thread-lock
- Paper towels

PARTS LISTING.

FUSELAGE ASSEMBLY

- □ (1) Fuselage
- □ (1) Canopy hatch

WING ASSEMBLY

- □ (1) Right wing half/ aileron
- □ (1) Left wing half with/ aileron
- □ (1) Aluminium dihedral brace

Tail section assembly

- (1) Horizontal stabilizer/ elevator halves.
- □ (1) Rudder halves.

Some more parts.

HARDWARE PACK

COWLING Landing gear.....

NOTE: To avoid scratching your new aeroplane we suggest that you cover your workbench with an old towel. Keep a couple of jars or bowls handy to hold the small parts after you open the bags.

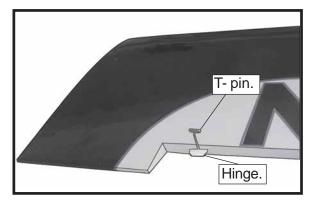

Please trial fit all parts. Make sure you have the correct parts and that they fit and are aligned properly before gluing! This will ensure proper assembly as the **GEEBEE** is made from natural materials and minor adjustments may have to be made. The paint and plastic parts used in this kit are fuel proof. However, they are not tolerant of many harsh chemicals including the following: paint thinner, cyano-acrylate glue accelerator, cyanoacrylate glue de-bonder and acetone. Do not let these chemicals come in contact with the colours on the covering and the plastic parts.

HINGING THE AILERONS.

Note: <u>The control surfaces, including the</u> <u>ailerons, elevators, and rudder, are</u> <u>prehinged with hinges installed, but the</u> <u>hinges are not glued in place. It is</u> <u>imperative that you properly adhere the</u> <u>hinges in place per the steps that follow</u> <u>using a high-quality thin C/A glue</u>.

 \Box 1) Carefully remove the aileron from one of the wing panels. Note the position of the hinges.

□ 2) Remove each hinge from the wing panel and aileron and place a T-pin in the center of each hinge. Slide each hinge into the wing panel until the T-pin is snug against the wing panel. This will help ensure an equal amount of hinge is on either side of the hinge line when the aileron is mounted to the aileron.

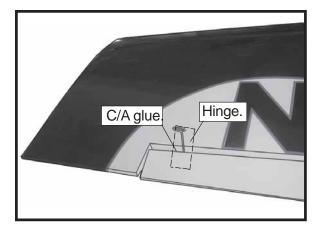

□ 3) Slide the wing panel on the aileron until there is only a slight gap. The hinge is now centered on the wing panel and aileron. Remove the T-pins and snug the aileron against the wing panel. A gap of 1/64" or less should be maintained between the wing panel and aileron.

□ 4)Deflect the aileron and completely saturate each hinge with thin C/A glue. The ailerons front surface should lightly contact the wing during this procedure. Ideally, when the hinges are glued in place, a 1/64" gap or less will be maintained throughout the lengh of the aileron to the wing panel hinge line.

Note: <u>The hinge is constructed of a special</u> material that allows the C/A to wick or penetrate and distribute throughout the hinge, securely bonding it to the wood structure of the wing panel and aileron.

□ 5) Turn the wing panel over and deflect the aileron in the opposite direction from the opposite side. Apply thin C/A glue to each hinge, making sure that the C/A penetrates into both the aileron and wing panel.

 \square 6) Using C/A remover/debonder and a paper towel, remove any excess C/A glue that may have accumulated on the wing or in the aileron hinge area.

 \Box 7) Repeat this process with the other wing panel, securely hinging the aileron in place.

□ 8) After both ailerons are securely hinged, firmly grasp the wing panel and aileron to make sure the hinges are securely glued and cannot be pulled out. Do this by carefully applying medium pressure, trying to separate the aileron from the wing panel. Use caution not to crush the wing structure.

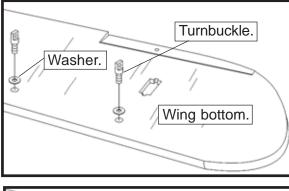

Note: <u>Work the aileron up and down several</u> times to "work in" the hinges and check for proper movement.

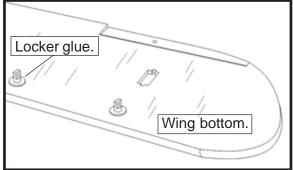

TURNBUCKLE INSTALLATION.

The hole location of turnbuckles shown in picture below .

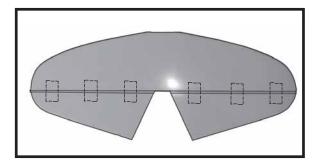

Installing the turnbuckle for the wing as same as pictures below.

HINGING THE ELEVATOR.

Glue the elevator hinges in place using the same tectniques used to hinge the ailerons.

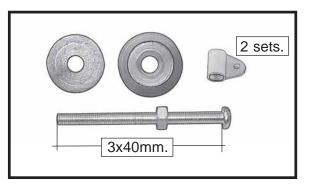

HINGING THE RUDDER.

Glue the rudder hinges in place using the same tectniques used to hinge the ailerons.

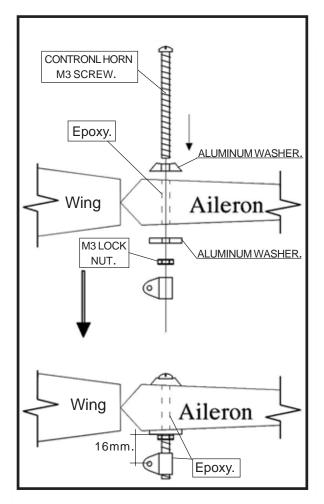

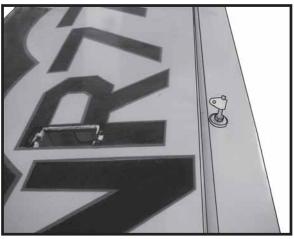

AILERON CONTROL HORN

Aileron control horn: See pictures below.

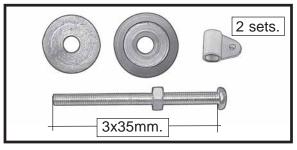

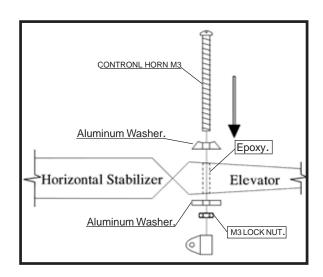

ELEVATOR CONTROL HORN.

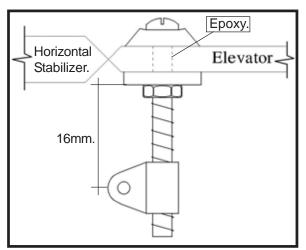

Install the elevator control horn using the same method as with the aileron control horns.

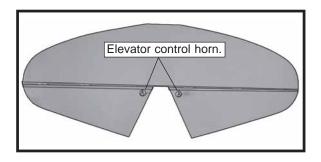

FACTORY BUILT MODEL

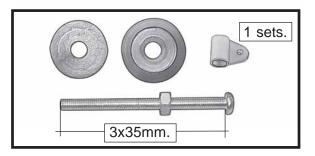

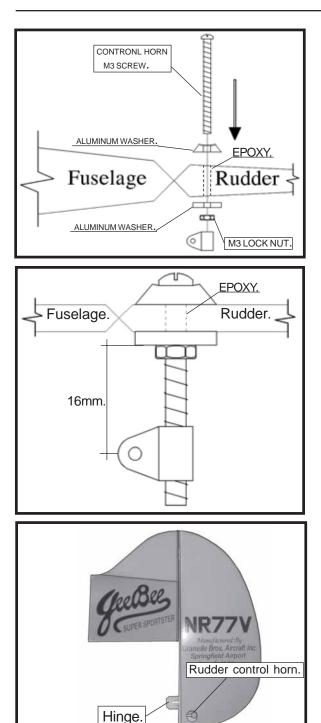

RUDDER CONTROL HORN.

Rudder control horn:

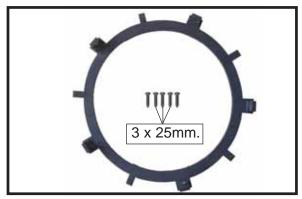

Using the same tectniques used aileron control horn. See picture below.

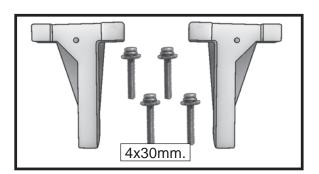

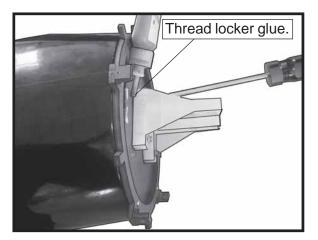

ENGINE MOUNT INSTALLATION.

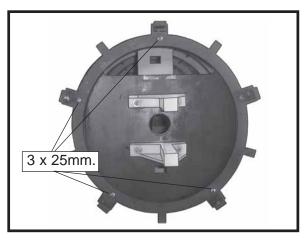

See pictures below.Make yourself the template of your engine on paper.

Mark and drill 4 holes for engine mount. Insert 4 blind nuts to firewall.

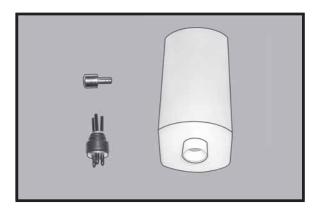

INSTALLING THE STOPPER ASSEMBLY.

 \Box 1) Using a modeling knife, carefully cut off the rear portion of one of the 3 nylon tubes leaving 1/2" protruding from the rear of the stopper. This will be the fuel pick up tube.

 \square 2) Using a modeling knife, cut one length of silicon fuel line. Connect one end of the line to the weighted fuel pick up and the other end to the nylon pick up tube.(The silicon tube is not included).

 \Box 3) Carefully bend the second nylon tube up at a 45° angle. This tube is the vent tube.

Carefully use a lighter or heat gun to permenently set the angle of the vent tube. **Important:** <u>When the stopper assembly is in-</u> <u>stalled in the tank, the top of the vent tube</u> <u>should rest just below the top surface of the</u> <u>tank. It should not touch the top of the tank</u>.

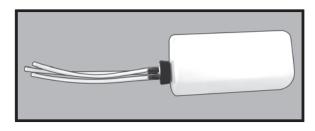

☐ 4) Test fit the stopper assembly into the tank. It may be necessary to remove some of the flashing around the tank opening using a modeling knife. If flashing is present, make sure none falls into the tank.

 \Box 5) With the stopper assembly in place, the weighted pick-up should rest away from the rear of the tank and move freely inside the tank. The top of the vent tube should rest just below the top of the tank. It should not touch the top of the tank.

 \Box 6) When satisfied with the alignment of the stopper assembly tighten the 3 x 20mm machine screw until the rubber stopper expands and seals the tank opening. Do not overtighten the assembly as this could cause the tank to split.

FUEL TANK INSTALLATION.

You should mark which tube is the vent and which is the fuel pickup when you attach fuel tubing to the tubes in the stopper. Once the tank is installed inside the fuselage, it may be difficult to determine which is which.

Blow through one of the lines to ensure the fuel lines have not become kinked inside the fuel tank compartment. Air should flow through easily.

MOUNTING THE ENGINE.

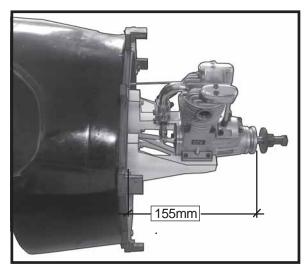

□ 1) Install the pushrod housing through the predrilled hole in the firewall and into the servo compartment. The pushrod housing should protrude 1/4" out past the front of the firewall.

Make a Z-Bend 1/4" from one end of the plain wire pushrod.

 \Box 2) Place your engine onto the engine mount. Adjust the engine is centered of the edges of the engine case.

□ 3) When you are satisfied with the alignment, mark the locations of the engine mounting.

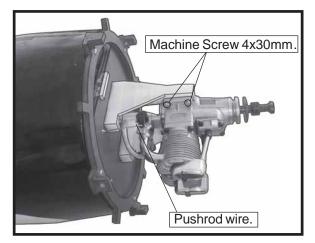

□ 4) Remove the engine. Using an drill bit, drill the mounting holes through the engine mount at the four locations marked.

 \Box 5) Bolt the engine to the engine mount using the four machine screws. Double check that all the screws are tight before proceeding.

 \square 6) Attach the Z-Bend in the pushrod wire to the throttle arm on the carburetor.

INSTALLING THE BATTERY.

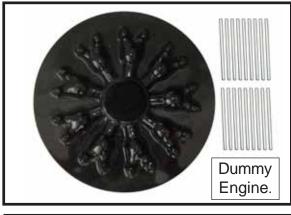

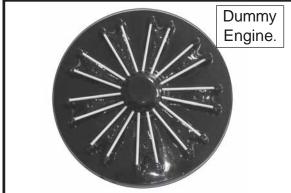

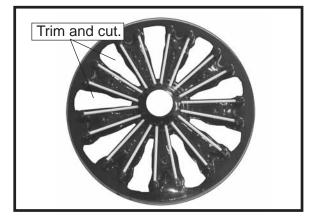

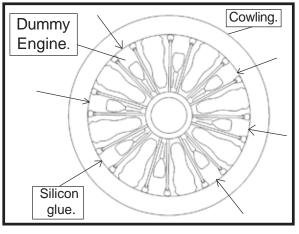

COWLING INSTALLATION.

□ 1) Slide the fiberglass cowl over the engine and line up the back edge of the cowl with the marks you made on the fuselage then trim and cut.

ACTORY BUILT MODEL

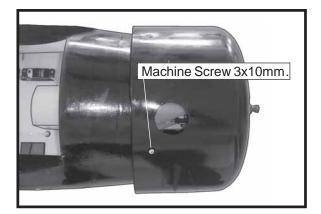

Because of the size of the cowl, it may be necessary to use a needle valve extension for the high speed needle valve. Make this out of sufficient length 1.5mm wire and install it into the end of the needle valve. Secure the wire in place by tightening the set screw in the side of the needle valve.

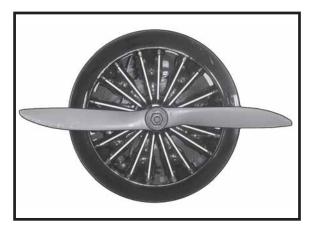

□ 2) While keeping the back edge of the cowl flush with the marks, align the front of the cowl with the crankshaft of the engine. The front of the cowl should be positioned so the crankshaft is in **nearly** the middle of the cowl opening. Use the spinner backplate as a guide. Hold the cowl firmly in place using pieces of masking tape.

 \Box 3) Install the muffler and muffler extension onto the engine and make the cut out in the cowl for muffler clearance. Connect the fuel and pressure lines to the carburetor, muffler and fuel filler valve. Secure the cowl to fuselage using the 3x10mm screws (4).

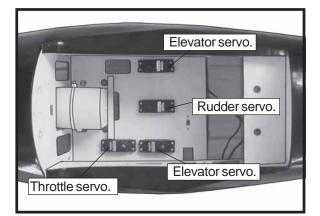

INSTALLING THE FUSELAGE SERVO.

Because the size of servos differ, you may need to adjust the size of the precut opening in the mount. The notch in the sides of the mount allow the servo lead to pass through. □ 1) Install the rubber grommets and brass collets onto the throttle servo. Test fit the servo into the aileron servo mount.

 \square 2) Secure the servos with the screws provided with your radio system.

INSTALLING THE SWITCH.

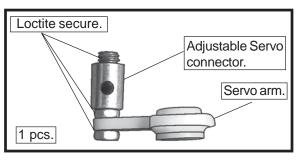

Install the switch into the precut hole in the side of fuselage.

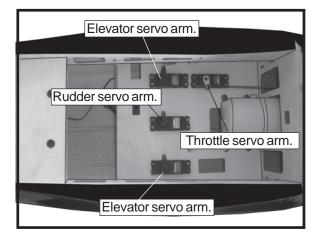

THROTTLE SERVO ARM INSTALLATION.

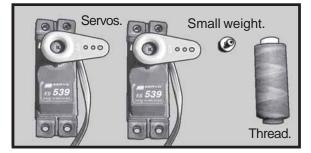

Install adjustable servo connector in the servo arm .

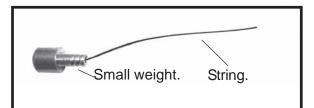

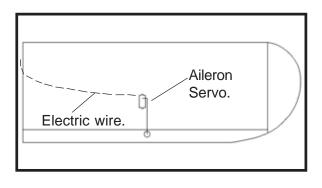

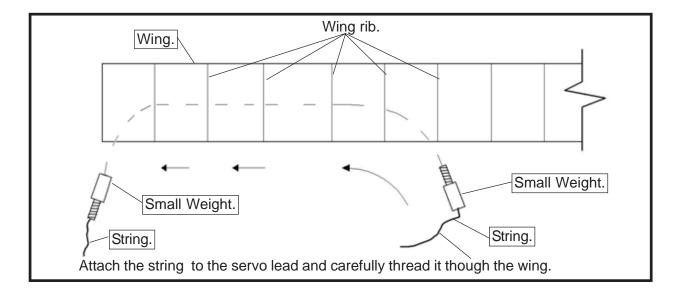

INSTALLING THE AILERON SERVOS.

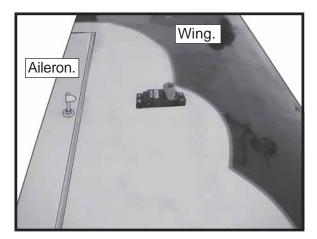

Installing the aileron servo in place using the same techniques used to flap servo.

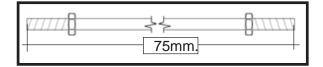

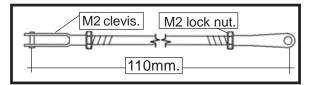

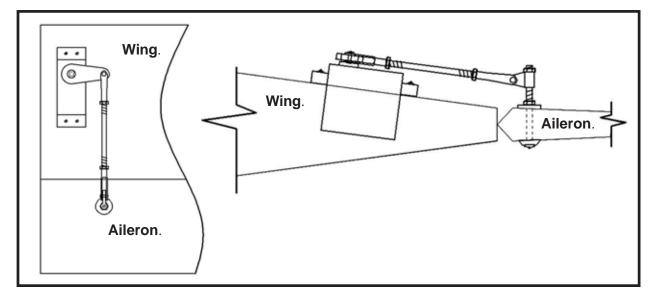

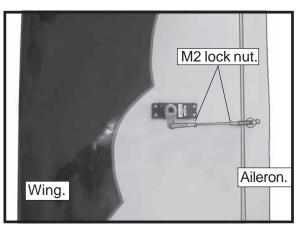

AILERON PUSHROD HORN INSTALLATION

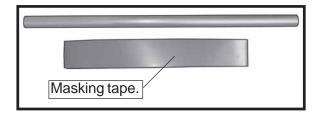

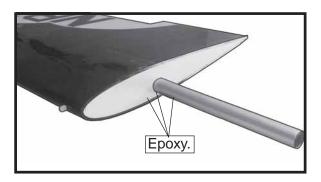

Repeat the procedure for the other wing.

WING ASSEMBLY.

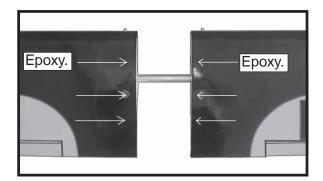

NOTE: <u>We highly recommend using 30</u> <u>minute epoxy as it is stronger and provides</u> <u>more working time, allowing the builder to</u> <u>properly align the parts. Using fast cure epoxy</u> <u>when joining the wing halves could result in the</u> <u>glue drying before the wing halves are aligned</u> <u>properly which may result in failure of the wing</u> <u>centre section during flight.</u>

 \Box 1) Test fit the wing tube into each wing half. The brace should slide in easily up to the centreline that you drew. If not, use 220 grit sandpaper with a sanding block and sand down the edges and ends of the brace until it fits properly.

 \Box 2) Remove the brace when satisfied with its fit ineach wing half. Coat the dihedral brace with 30 minute epoxy. Next, pour some epoxy into the dihedral box in one wing panel. Make sure you cover the top and bottom as well as the sides of the dihedral brace.Use enough epoxy to fill any gaps.

Carefully slide the two wing halves together and firmly press them together, allowing the excess epoxy to run out. There should not be any gap in the wing halves. Use rubbing alcohol and a paper tower to clean up any excess epoxy.

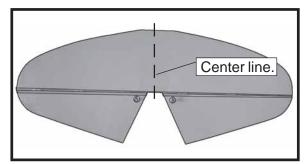

Apply masking tape at the wing join to hold the wing halves together securely.

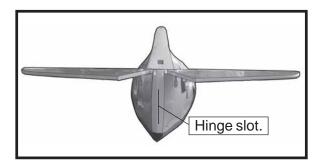

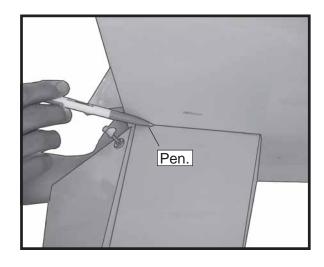

□ 3) Peel off the backing from the self adhesive covering strip. Apply the strip to the centre section of the wing starting from the bottom trailing edge. Wrap the strip all the way around the wing until it meets the trailing edge again. Trim off any excess strip.

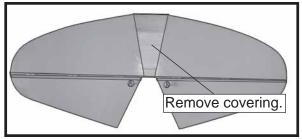

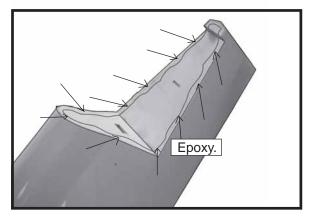

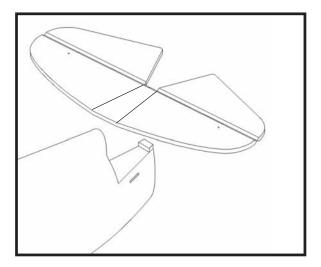

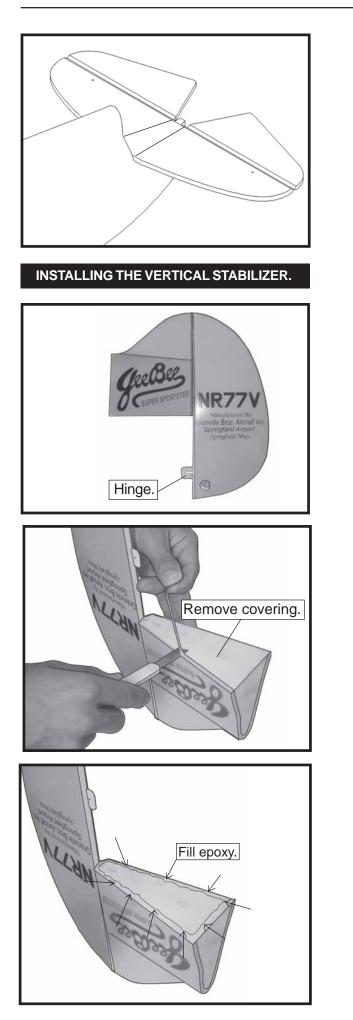

When cutting through the covering to remove it, cut with only enough pressure to only cut through the covering itself. Cutting into the balsa structure may weaken it.

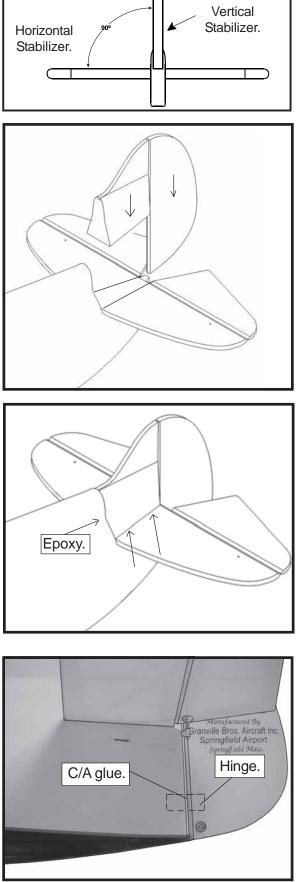

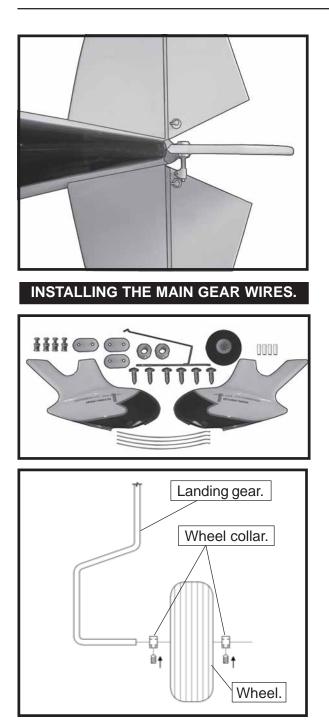

INSTALLING THE HORIZONTAL STABILIZER.

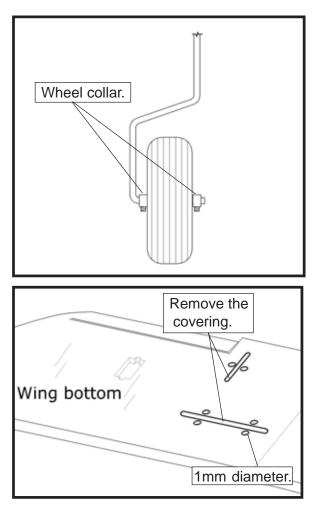

Put the vertical stabilizer into the in the top of the horizontal fin. The bottom edge of the stabilizer should also be firmly pushed against the top of the horizontal stabilizer.

 \Box 1) Using a modeling knife, remove the covering from over the two main gear mounting slots located in the bottom of the wing.

 \square 2) Insert the 90° bend of one main gear wire into the predrilled hole in one mounting slot.

 \Box 3) Using the two landing gear straps as a guide, mark the locations of the four 3 x 10mm mounting screws onto the wing surface.

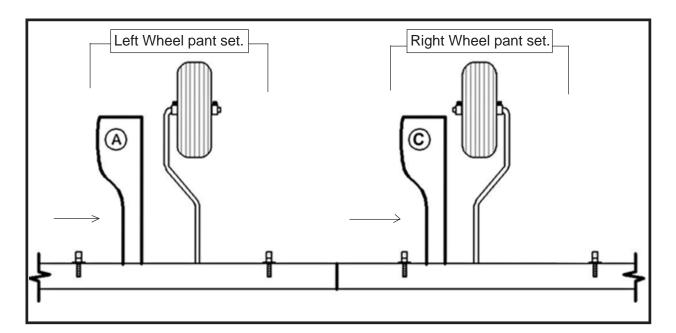

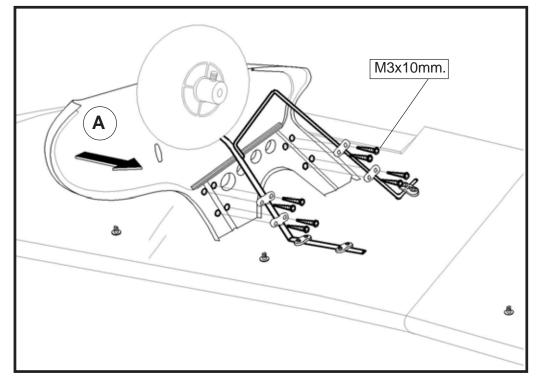

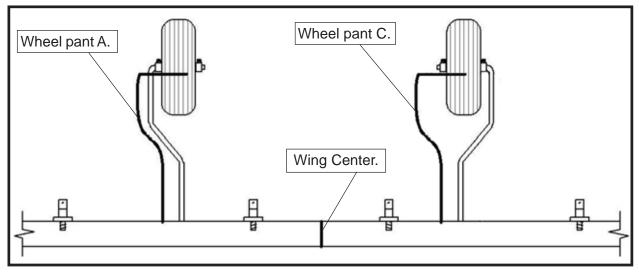

WHEEL PANT INSTALLATION.

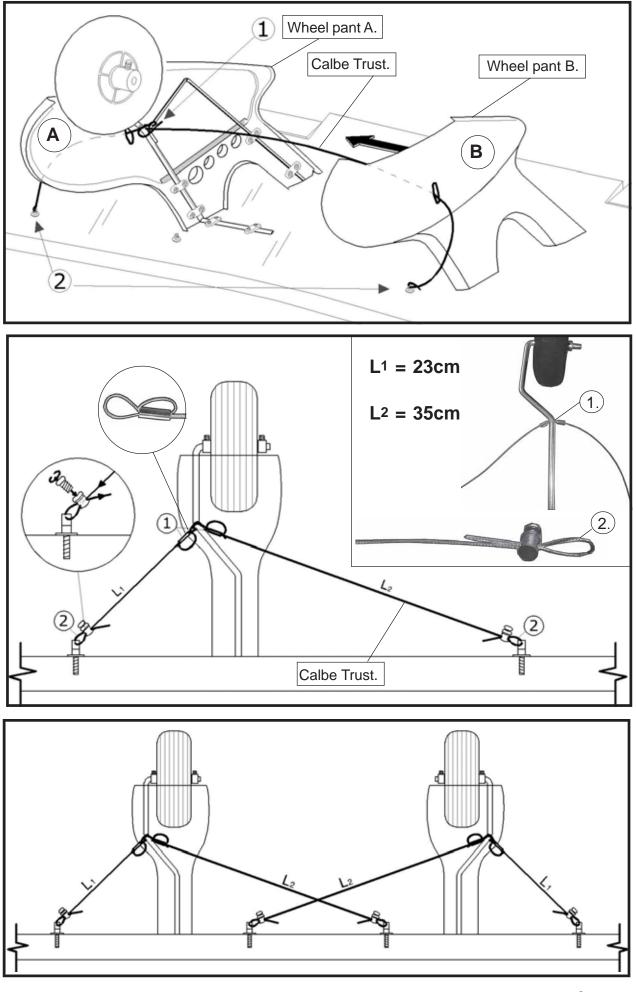

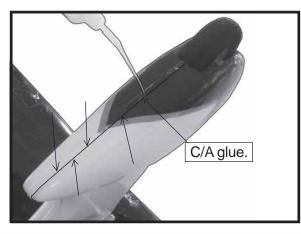

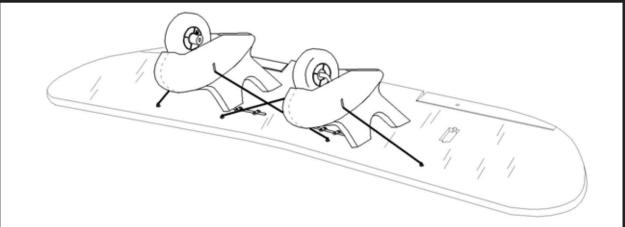

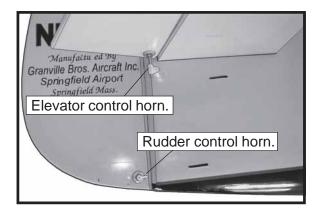

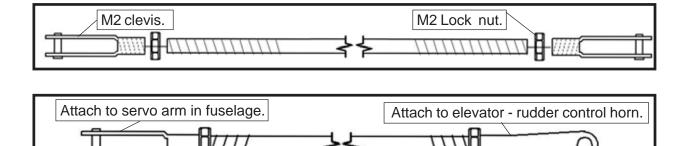

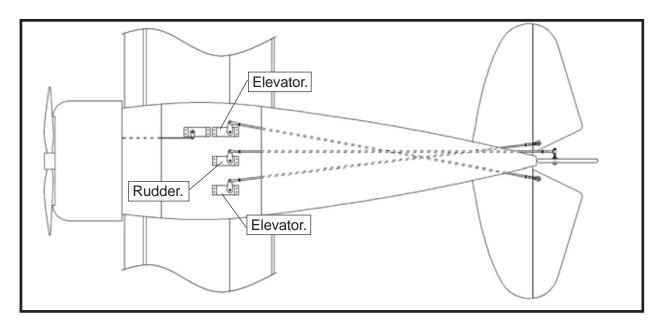

ELEVATOR-RUDDER PUSHROD HORN INSTALLATION.

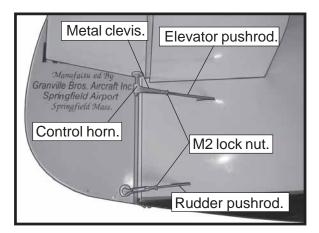

□ 1) Elevator and rudder pushrods assembly follow pictures below.

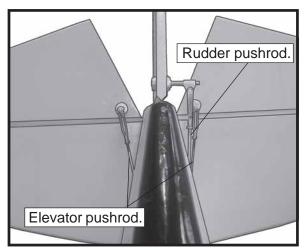

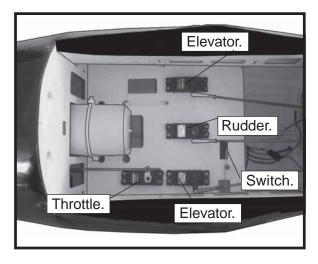

□ 2) Connect the elevator and rudder servos to your radio's receiver and turn on the system. Set the trim tabs on the transmitter to neutral and center the servo arms. The elevator and rudder servo arms should be perpendicular to the servos.

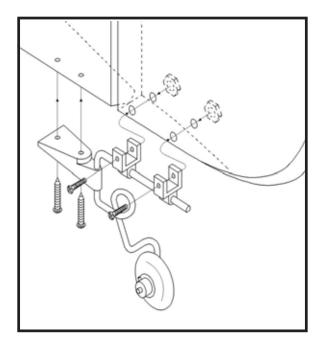

□ 3) One at a time, hold the pushrods in position over the respective servos to check for proper servo direction. If any servo turns in the wrong direction, switch your radio's reversing switches as necessary to achieve the correct direction.

 \Box 4) Install servos arm to servos. Notice the position of the servo arms on the servos. See picture below.

MOUNTING THE CONTROL CLASP.

WING FILLET INSTALLATION.

See pictures below:
